

# LCA on virtual water and embodied energy in food consumption

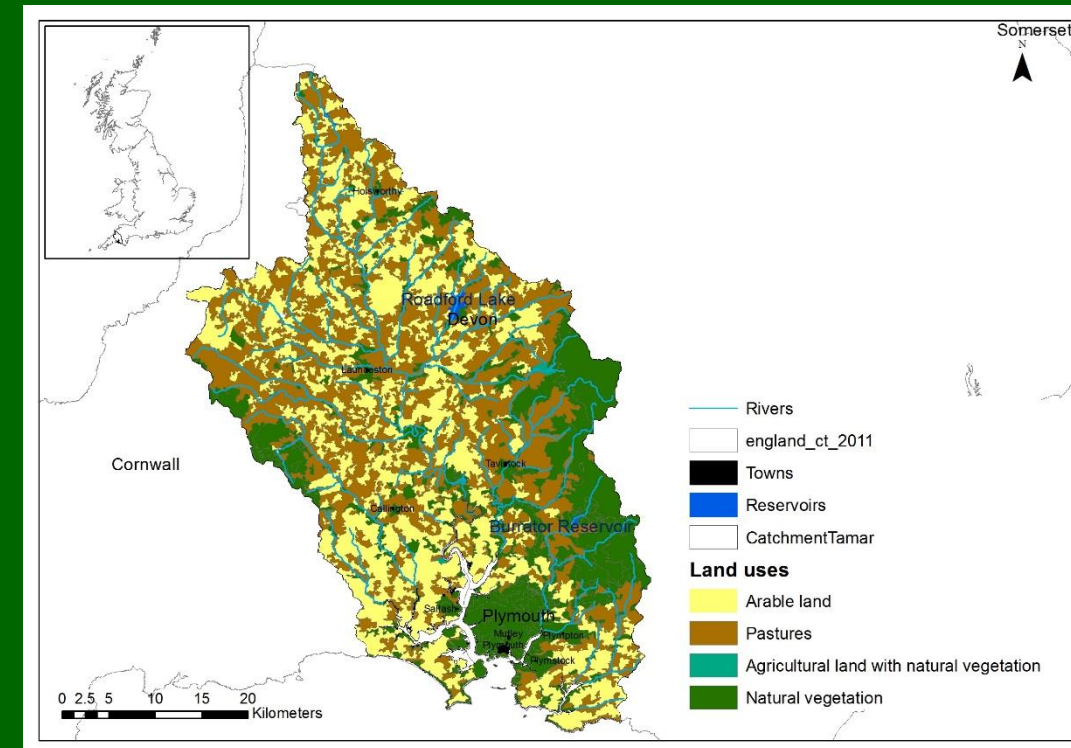

Gloria Salmoral – Cranfield University  
Xiaoyu Yan – University of Exeter

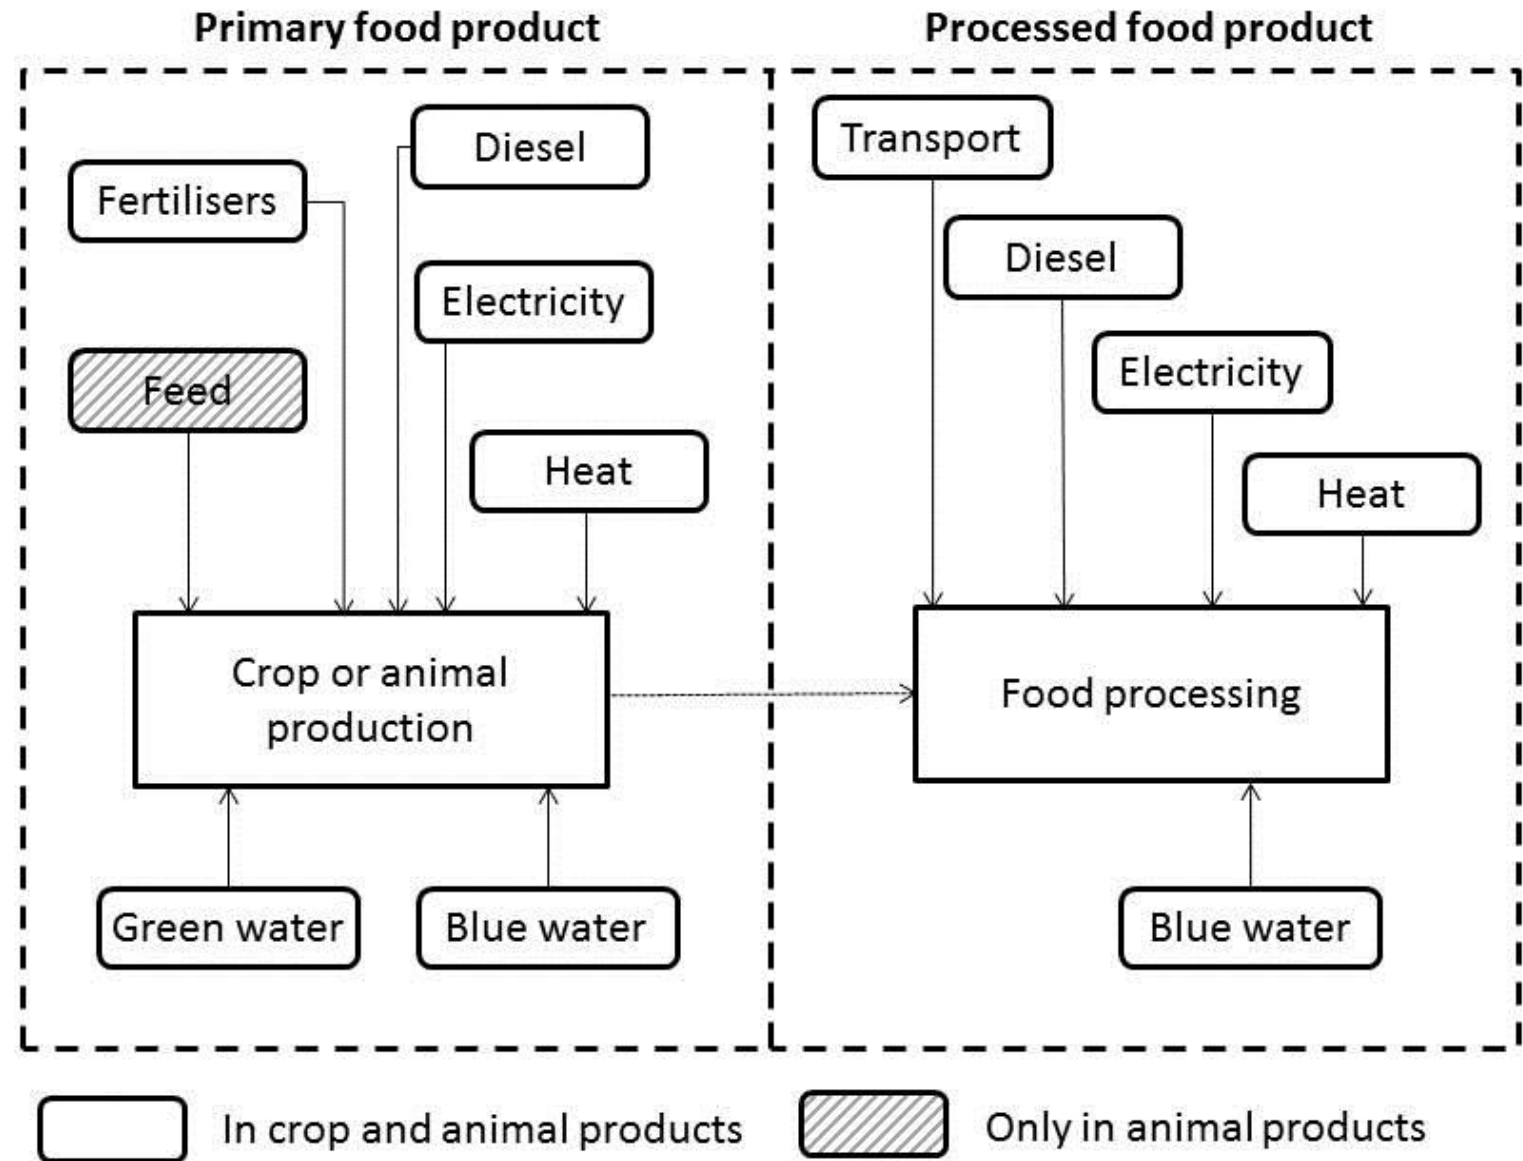

# Our aim in the Tamar catchment

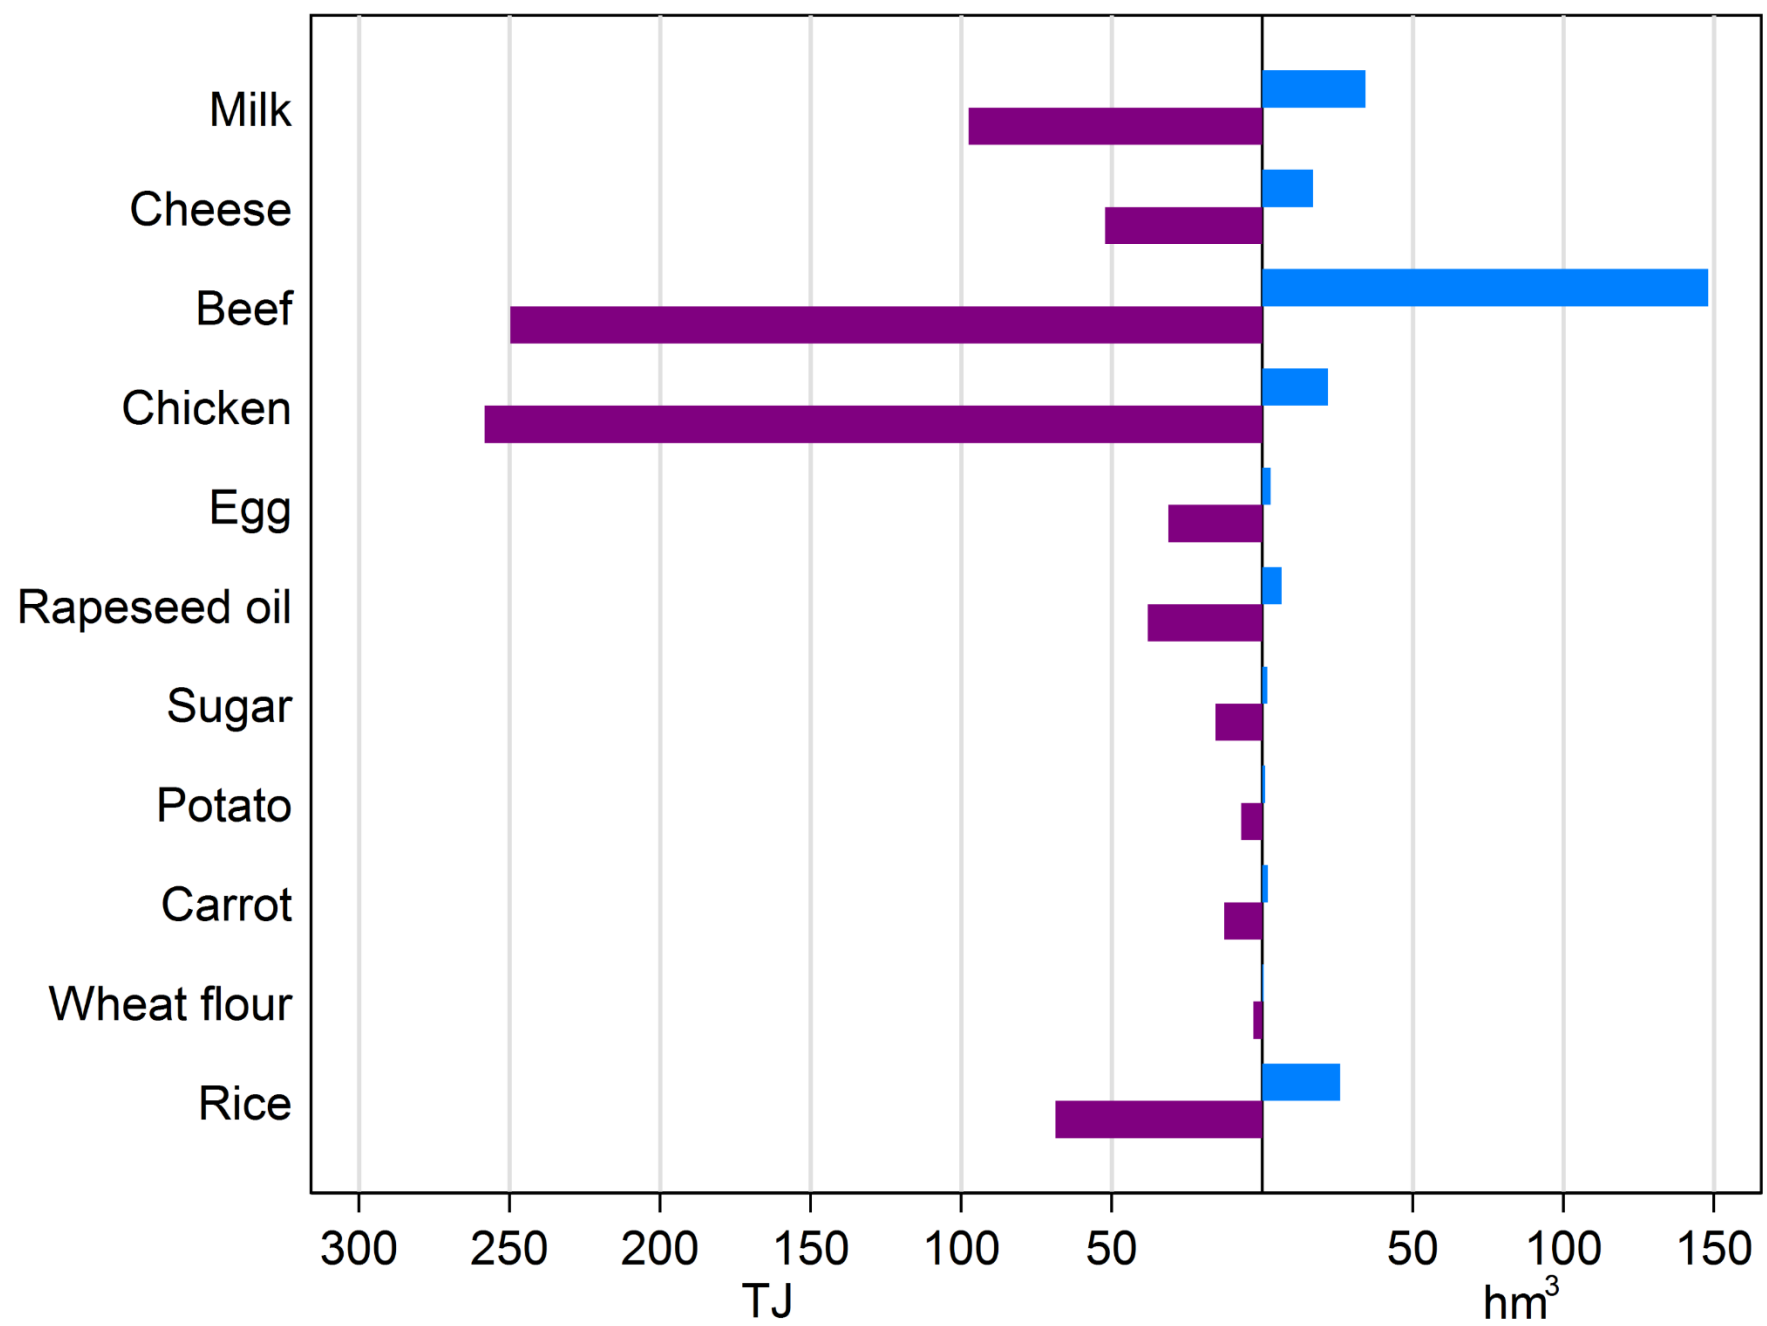

- To evaluate the upstream virtual water and embodied energy in food consumption in the Tamar catchment, distinguishing between domestic production and imports origin.
- To evaluate key inputs, including virtual nutrients and animal feed, when tracking supply chain of food products.

# Our system boundaries for the selected food products

Embodied energy  
and  
virtual water  
(blue water +  
green water)

# Resources embedded by food product and source of production

# Key messages

- Catchment-scale LCA of food based on diets and available LCA inventory databases
- Significant shares of embodied energy and virtual water in food found to be imported
- Water and energy hotspots highlight potential risks and trade-offs in food life cycle
- Currently available LCA databases offer potential for FEW nexus assessments
